1 Background and Theory

2 Research Design

3 Measures and Results

4 Conclusion

Background

- International Organization for Standardization (ISO) is one of the largest and most comprehensive voluntary bodies for industrial standard-setting, encompassing hundreds of Technical Committees (TCs) across a wide range of sectors.

Background

- International Organization for Standardization (ISO) is one of the largest and most comprehensive voluntary bodies for industrial standard-setting, encompassing hundreds of Technical Committees (TCs) across a wide range of sectors.
- Key principles in ISO standard development:
 - Respond to a need in the market
 - Based on global expert opinion
 - Developed through a multi-stakeholder process
 - Based on a consensus

Research Question

- Does ISO function primarily as a technical forum for cooperation, or does it reflect **hub-and-spoke structures** in which a handful of states exercise outsized influence?

Stages of Developing an ISO Standard

- ISO follows a consensus-based process with six stages:
 - 1 Proposal (NWIP): New project proposed; members approve.
 - 2 Preparatory (WD): WG drafts and refines text.
 - 3 Committee (CD): Circulated for comments; revised.
 - 4 Enquiry (DIS): All members vote (2/3 majority, <25% negative).
 - 5 Approval (FDIS): Final vote before adoption.
 - 6 Publication: Secretariat publishes the standard.

China's ISO Participation Strategy

- Deng Xiaoping era:
 - ISO was about economic modernization.
 - Participation is to aligning domestic products with international standards to promote exports.

China's ISO Participation Strategy

- Deng Xiaoping era:
 - ISO was about economic modernization.
 - Participation is to aligning domestic products with international standards to promote exports.
- Xi Jinping era:
 - China's geopolitical toolkit

China's ISO Participation Strategy

- Deng Xiaoping era:
 - ISO was about economic modernization.
 - Participation is to aligning domestic products with international standards to promote exports.
- Xi Jinping era:
 - China's geopolitical toolkit
 - Through the Standardization Administration of China, mobilizes resources across agencies and enterprises

China's ISO Participation Strategy

- Deng Xiaoping era:
 - ISO was about economic modernization.
 - Participation is to aligning domestic products with international standards to promote exports.
- Xi Jinping era:
 - China's geopolitical toolkit
 - Through the Standardization Administration of China, mobilizes resources across agencies and enterprises
 - 2015 to 2018, Zhang Xiaogang served as the first Chinese President of ISO → numbers of participation in TCs, subcommittees (SCs), and secretariat positions holding increases

China's ISO Participation Strategy

- Deng Xiaoping era:
 - ISO was about economic modernization.
 - Participation is to aligning domestic products with international standards to promote exports.
- Xi Jinping era:
 - China's geopolitical toolkit
 - Through the Standardization Administration of China, mobilizes resources across agencies and enterprises
 - 2015 to 2018, Zhang Xiaogang served as the first Chinese President of ISO → numbers of participation in TCs, subcommittees (SCs), and secretariat positions holding increases
 - Standardization now serves multiple goals: strengthening state-owned enterprises, reducing patent licensing costs, and projecting influence by promoting a “China model” that resonates with developing countries.

Our Network Perspective

ISO is not simply as a site of technical collaboration but as a **relational structure** where influence may emerge from network embeddedness as much as from formal authority.

1 Background and Theory

2 Research Design

3 Measures and Results

4 Conclusion

Network Data and Methods

- Conceptualize ISO as cooperation network
- 17 sectors, 349 technical committees (Note: One TC can cover multiple sectors, overlapped with other TCs)
- Network measures: density, clustering , centrality, degree inequality, and community detection

13	Freight, Package and Distribution
14	Security, Safety and Risk
15	Services
16	Special Technologies
17	Transport

1 Background and Theory

2 Research Design

3 Measures and Results

4 Conclusion

Density

Network density captures the overall level of connectedness in the system. It is defined as the ratio of observed ties to all possible ties:

$$\text{Density} = \frac{2m}{n(n-1)}, \quad (1)$$

where m is the number of observed edges and n is the total number of nodes. Density ranges from 0 to 1, with higher values indicating a more cohesive network in which states are more broadly connected.

Clustering Coefficient

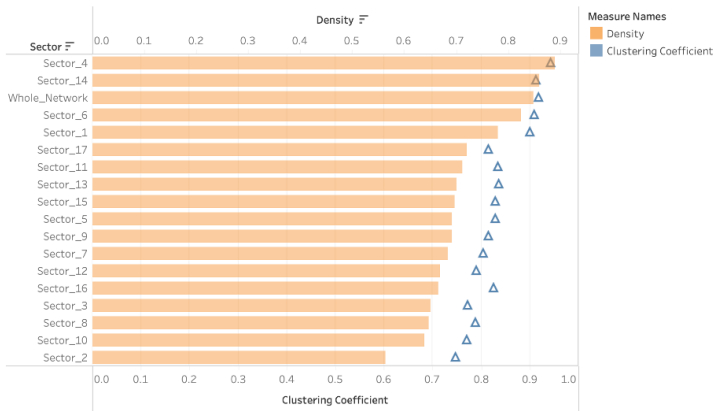

Clustering, by contrast, captures the tendency of the network to form tightly connected groups through triadic closure. The global clustering coefficient summarizes this property at the system level and is defined as the average of the local clustering coefficients across all nodes:

$$C = \frac{1}{n} \sum_{i=1}^n C_i, \quad (2)$$

where C_i is the local clustering coefficient of node i , measuring the proportion of ties that exist among its neighbors. **Higher values indicate the presence of cohesive subgroups or coalition-like structures within ISO.**

Result

Network Centrality: Popularity and Privilege

Degree centrality measures how many direct connections a state has within the network (Freeman 1979). In an undirected network such as ISO, the degree of a node is defined as the number of other nodes to which it is directly connected, calculated as:

$$D(i) = \deg(i) = \sum_{j=1}^n a_{ij}, \quad (3)$$

Results

Results

Figure 1: Degree rankings of the top 10 ISO member states across all 17 sectors. The figure illustrates that China consistently ranks at the top in nearly every sector.

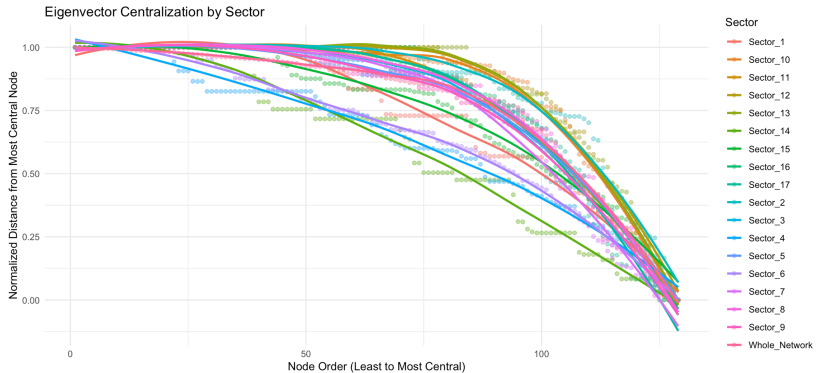

Eigenvector Centrality

The eigenvector centrality of node i is defined as the i -th entry of the eigenvector associated with the largest eigenvalue of A . Equivalently, the centrality of a node is proportional to the summed centralities of its neighbors:

$$E(i) = \frac{1}{\lambda} \sum_{j=1}^n a_{ij} E(j), \quad (4)$$

where a_{ij} is the adjacency matrix entry between nodes i and j , and λ is the largest eigenvalue of A . This formulation captures how influence can cascade through the network: a state connected to influential partners is itself more influential.

Results

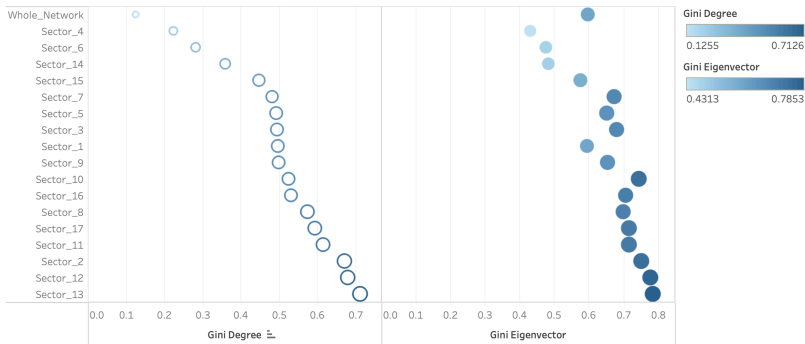

Imbalanced Connection

To further investigate the selective nature of cooperation in the ISO network, we examine both popularity (degree centrality) and privilege (eigenvector centrality) through their distributional inequality.

$$G_D = \frac{\sum_{i=1}^n \sum_{j=1}^n |D(i) - D(j)|}{2n \sum_{i=1}^n D(i)}, \quad (5)$$

$$G_E = \frac{\sum_{i=1}^n \sum_{j=1}^n |E(i) - E(j)|}{2n \sum_{i=1}^n E(i)}, \quad (6)$$

Results

Community Detection

Louvain method assumes that states cluster into cooperation blocs when they share denser ties with each other than with the broader membership (Blondel et al. 2008; Traag et al. 2019).

This means that ISO's cooperation structure is not treated as random overlap but as reflecting underlying patterns of selective alignment: states are more likely to cooperate repeatedly within certain groups, forming cohesive coalitions.

Results: Top 3 Most imbalanced Communities

Louvain Communities in Sector_13

(a) Sector 13: Freight, Package and
Distribution

3 Measures and Results

4 Conclusion

Conclusion and Future Direction

- ISO is not simply a forum for technical cooperation. It is a networked structure where technical collaboration coexists with strategic alignment.
- Limitation: The Sector–TC network shows China's systemic centrality, but not genuine **influence**. It captures “activeness”—broad participation across TCs/sectors. China's dominance is echoing literature on its strategic ISO participation.

Conclusion and Future Direction

- ISO is not simply a forum for technical cooperation. It is a networked structure where technical collaboration coexists with strategic alignment.
- Limitation: The Sector–TC network shows China's systemic centrality, but not genuine **influence**. It captures “activeness”—broad participation across TCs/sectors. China's dominance is echoing literature on its strategic ISO participation.
- Next step: case study, process tracing, access to internal data (NWIP (New Work Item Proposal) ballot form, committee documents, and subcommittee network)
